DISCHARGE VALVE ASSEMBLY

Representative drawing

(57) Abstract:

PURPOSE: A discharge valve assembly is provided to prevent vibration from increasing in a high-frequency area by stabilizing on/off action of a discharge valve.

CONSTITUTION: Refrigerant gas is introduced into a compressing space(S1) by opening a suction valve(3) through the backward movement of a piston(1). The refrigerant gas is compressed by the piston and then discharged to outside through a discharge pipe(140) from another space(S2). At the same time, the refrigerant gas flows into the empty discharge space(S2) through a gap between the discharge valve and cover (120,110) when the discharge valve is displaced from a cylinder(2). The compressing space has relatively lower pressure than the discharge one in the backward movement of the piston. Thus, the discharge valve returns to the cylinder with a valve spring(130) to divide the two spaces. The working mode of the valve spring is stabilized in expanding/contracting the spring by supporting the valve spring with more than three points.
